The Removable Singularity Framework

Abstract

After meaning-as-role (Ch.61), what makes a form beautiful? Beauty is information at a boundary. Measured empirical entropy and zlib compression of five input classes: constant ($H=0 \rightarrow$ boring $A=0.000$), rhythm, the Fibonacci word ($A=0.773$ - the golden structure wins), language ($A=0.615$), and random noise ($A=0.365$ - chaotic). The Schmidhuber-style aesthetic measure $A = \text{novelty} \times \text{simplicity}$ peaks between purity and noise. Birkhoff (1933) $M = \text{Order/Complexity}$ is the ratio of the two poles - literally our 0/0. And music: consonance is small ratios (Helmholtz 1863); measured 12-TET errors are 0.00 cents (octave), 1.96 (fifth), 13.69 (major third). Beauty is the removable singularity of taste.

1. Entropy and Compression (Shannon 1948)

Beauty is form, and form is measured. Computed over 3600-char inputs: constant unigram/bigram entropy 0.000/0.000; rhythm 1.000/0.500; Fibonacci word 0.959/0.776; language 4.159/3.432; random 4.752/4.681 bits. zlib ratios: 0.007 (constant), 0.148 (language), 0.629 (random). Pure order bores; pure noise repels; the sublime sits between.

2. The Aesthetic Measure

$$M = O / C \quad (\text{Birkhoff 1933})$$

Order over Complexity: pure order $O=1$, $C \rightarrow 0$ blows the ratio up; pure noise $O \rightarrow 0$ collapses it. The ratio is our 0/0: $M = O/C$ with $O, C \rightarrow 0$ is the removable singularity of taste. Schmidhuber (1997): $A = \text{simplicity} \times \text{novelty}$. Measured: golden 0.773, language 0.615, rhythm 0.496, random 0.365, constant 0.000.

3. Harmony Is Small Ratios (Helmholtz 1863)

Consonance = low-complexity frequency ratios. Equal temperament errors measured: unison and octave 0.00 cents (exact), perfect fifth 3:2 drifts 1.96 cents, major third 5:4 drifts 13.69 cents. Equal temperament pays 12 small debts to make all keys playable - pure perfection traded for universal beauty.

4. The 0/0 Proof

Beauty is beautiful when both poles vanish. Too much order (entropy $\rightarrow 0$): boredom. Too much surprise (entropy $\rightarrow 1$): disgust. The sublime is the removable singularity of the senses - the point where order and surprise cancel and the form appears. Like the zero: nothing, boundary, rule, beauty.

5. Connections

Concept	Prior Chapter	Connection
Meaning	Ch.61 Meaning	The role is the form
Golden Rule	Ch.60 Golden Rule	Symmetry is beautiful order
Chaos	Ch.43 Chaos Theory	Novelty: edge of prediction
Time	Ch.48 Arrow of Time	Beauty is the drift of becoming
Eternal return	Ch.57 Eternal Return	The form survives the change
The 0	Ch.01 The Zero	Emptiness is the eye of form

6. Conclusion

Beauty is the 0/0 of aesthetics: the form is nothing in itself and everything in role. Measured: the golden Fibonacci structure tops the aesthetic measure (0.773); language, the soul of structure with surprise, follows (0.615); noise and repetition fail at the poles. The perfect ratio is the removable singularity of taste - the point where order and novelty meet, and the world becomes visible as a pattern.
